

OPIOID PAIN MEDICATION AGREEMENT

Place name sticker or stamp with card

Opioid treatment agreements

To help in getting my long standing pain in better control, and to help me reach the goals I have set (see pain goals), opioid pain medication is being prescribed for me. In order to make this medication safe and follow national and state laws, I understand that:

- This medication may not take away all my pain.
-I should follow the directions given to me by my health care provider. I will not take more than what I am told to take.
-There are side effects of this medication described to me by my health care provider. All my questions about this medication have been answered.
-I will call my health care provider's office if I am having side effects after starting this medication.
-This medication may make me sleepy. Driving or operating machinery while taking this medication can be dangerous.
-Taking alcohol or street drugs along with this medication is dangerous.
-My body may get used to the medication and if I stop it too quickly I could get sick.
-Some people have become addicted to these medications. If I think this is happening to me I will speak to my health care provider.

Patient's Signature Date

I agree: (patient's name)

- To obtain pain medication only from the health care provider signed below, or his/her medical team, and to notify my provider immediately if I obtain any pain medication from an emergency room.
-Only to get pain medication during regular office hours and not to call after office hours for pain medication.
-To fill my medications only at one pharmacy which is
-To give urine samples and to bring in my pills to be counted whenever asked of me.
-Not to use illegal drugs along with this medication.
-Not to sell or give away my medication.
-To keep my medication safe. If it is lost or stolen I understand it may not be replaced.
-To allow my health care provider to exchange information with people who might need to know about my medication use if he/she thinks it is necessary for my health and safety.
-To keep all of my health care appointments recommended to me to treat my pain.
-That my medication can be stopped at any time, after a discussion with my health care provider.

Patient's Signature Date

I agree: (health care provider's name)

- To explain your pain condition and how opioids are expected to help.
-To explain the risks, side effects and alternatives to opioid treatment.
-To monitor your pain level at each visit to help assure good pain control and help meet your goals (see goal sheet).
-To continue to change the plan for pain control as needed to get good control of pain.
-To include a pain specialist, and/or other health care specialists (such as Behavioral Health, Physical Therapy, Massage Therapy, Acupuncture and Osteopathic Manipulation) in your care, as needed to reach your goals.
-To keep you safe, to the best of my abilities, while you are taking opioid medications. I will provide help should you become addicted.

Health Care Provider's Signature Date

Notes about treatment agreements

- Treatment Agreements are documents created by different practices to help provide education and information articulating rationale and risks of treatment
- Helps to counsel patient on the risks and benefits of opioid analgesics, and obtain verbal informed consent for their use
- They are NOT “pain contracts”
 - Using such language can impede patient-provider communication
- Efficacy not well established
 - No standard or validated form
 - No evidence they are detrimental
- But they are helpful
 - They should help a provider and patient have a conversation regarding the planned therapeutic regimen.
 - Takes “pressure” off provider to make individual decisions (Our clinic policy is...)

Issues to discuss in opioid agreement

- Discuss risks of opioid medications to help determine if benefits outweigh risks and to inform patients
 - Side effects – physical dependence – sedation
 - Drug interactions
 - Risk of misuse – abuse, addiction, death
 - Legal responsibilities – disposing, sharing
- Assign responsibility to look for early signs of harm
- Discuss monitoring, pill counts, drug tests, etc. as ways that help to protect patient from undue harm
 - Compare to statins and LFT monitoring analogy
 - Articulate monitoring (tox screen, pills counts) & action plans for aberrant medication taking behavior
- Use a consistent approach, but set level of monitoring to match risk

Naloxone and opiate overdose

- Death generally occurs within 1-3 hours of overdose (Kin, 2009)
- Bystander Naloxone use is associated with increased odds of recovery (Giglio, 2015)
- Discuss Naloxone with all patients who have an opiate use disorder
- Explain signs and symptoms of overdose (handouts and videos may help)

Naloxone Co-Prescribing

- Should be considered with all chronic opiate prescriptions
 - Death generally occurs within 1-3 hours of overdose (Kim, 2009)
- Bystander naloxone use is associated with increased odds of recovery (Giglio, 2015)
- Explain signs and symptoms of overdose
 - Classic triad: pinpoint pupils/very small pupils, unconsciousness/not responsive/won't wake up, respiratory depression/barely breathing/slow
- Share [handouts](#) and review naloxone use
- Share website with [videos](#) regarding OD recognition and naloxone use by patients and bystanders

Naloxone for Overdose Prevention

"IMPORTANT:

patient name Administering
 date of birth Naloxone to someone
 patient address who has NOT used
opiates does NO
harm"
 patient city, state, ZIP code _____

Detach for patient

How to Avoid Overdose

- Only take medicine prescribed to you
- Don't take more than instructed

- Call a doctor if your pain gets worse
- Never mix pain meds with alcohol
- Avoid sleeping pills when taking pain meds

- Dispose of unused medications
- Store your medicine in a secure place
- Learn how to use naloxone

- Teach your family + friends how to respond to an overdose

Are they breathing? → Call 911 for help

Signs of an overdose:

- Slow or shallow breathing
- Gasp for air when sleeping or weird snoring
- Pale or bluish skin
- Slow heartbeat, low blood pressure
- Won't wake up or respond (rub knuckles on sternum)

Call 911 for help

All you have to say:

"Someone is unresponsive and not breathing."
 Give clear address and location.

Airway → Rescue breathing

Make sure nothing is inside the person's mouth.

Rescue breathing

Oxygen saves lives. Breathe for them.

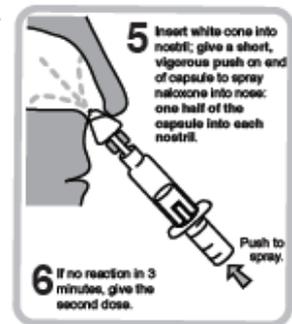

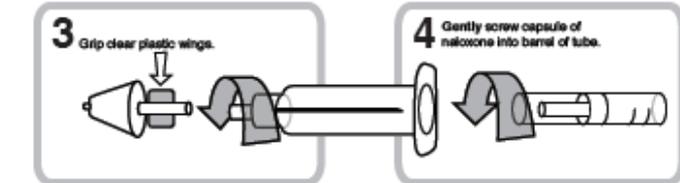

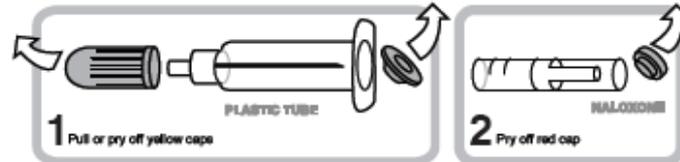

One hand on chin, tilt head back, pinch nose closed.
 Make a seal over mouth & breathe in
 1 breath every 5 seconds
 Chest should rise, not stomach

Prepare Naloxone

Are they any better? Can you get naloxone and prepare it quickly enough that they won't go for too long without your breathing assistance?

PrescribeToPrevent.org

Source: HamReduction.org

Evaluate + support

- Continue rescue breathing
- Give another 2 sprays of naloxone in 3 minutes if no or minimal breathing or responsiveness
- Naloxone wears off in 30-90 minutes
- Comfort them; withdrawal can be unpleasant
- Get them medical care and help them not use more opiate right away
- Encourage survivors to seek treatment if they feel they have a problem

Naloxone Product Comparison								
	Injectable (and intranasal-IN) generic		Intranasal branded		Injectable generic ¹		Auto-injector branded	
Sig. (for suspected opioid overdose)	Spray 1 ml (1/2 of syringe) into each nostril. Repeat after 2-3 minutes if no or minimal response.		Spray 0.1 mL into one nostril. Repeat with second device into other nostril after 2-3 minutes if no or minimal response.		Inject 1 mL in shoulder or thigh. Repeat after 2-3 minutes if no or minimal response.		Inject into outer thigh as directed by English voice-prompt system. Place black side firmly on outer thigh and depress and hold for 5 seconds. Repeat with second device in 2-3 minutes if no or minimal response.

Naloxone Standing Order:

- Naloxone is available in Massachusetts without a prescription through a statewide standing order.
- <https://www.mass.gov/files/documents/2018/10/18/standing-order-dispensing-naloxone-rescue-kits.pdf>

Intranasal administration	Intramuscular injection
Naloxone 4 mg/0.1 mL nasal spray* Directions for use: Administer a single spray of naloxone in one nostril. Repeat after 3 minutes if no or minimal response.	Naloxone 0.4 mg/mL in 1 mL single dose vials* Directions for use: Inject 1 mL IM in shoulder or thigh. Repeat after 3 minutes if no or minimal response.
Naloxone 2 mg/2 mL single-dose Leur jet prefilled syringe*† Directions for use: Spray 1 mL in each nostril. Repeat after 3 minutes if no or minimal response.	Naloxone 2 mg/0.4 mL auto-injector* Directions for use: Follow audio instructions from device. Place on thigh and inject 0.4 mL. Repeat after 3 minutes if no or minimal response.

*Dispense two doses

† Atomizer dispensed separately

Recognition of Opioid Overdose

- Classic triad:
 - Coma (depressed mental status)
 - Pinpoint pupils
 - Respiratory depression (<12 breaths/min in adults)
 - All three may not be present
 - Patients in recovery can be prescribed opiates when benefit outweighs risk (such as major surgery, trauma), but there must be careful planning, open discussion, safe dispensing and close monitoring.
 - Increasingly opioid deaths involve fentanyl, either alone or in combination with heroin

CLINICAL GUIDE FOR CHANGING OPIOID ANALGESICS

Oral / Rectal (mg)	Analgesic	Parenteral (mg)
200	Codeine	100
300	Tramadol	-
30	Hydrocodone	-
30	Morphine	10
20	Oxycodone	-
6	Hydromorphone	1.5
(-)	Fentanyl	0.1 (100mcg)
	Oxymorphone	

CALCULATING FORMULA

To convert from one opioid or route of administration to another opioid or route of administration:

$$\text{current opioid dose (mg), route} \times \left(\frac{\text{FROM CHART desired opioid}}{\text{current opioid}} \right) = \text{desired opioid dose (mg), route}$$

ADJUSTING FOR INCOMPLETE CROSS TOLERANCE

Based on level of pain control at the time of conversion

Poor pain control	100%
Moderate pain control	75%
Excellent pain control	50%

FENTANYL CONVERSION

(not to be used for acute pain management)

Oral Morphine	50-100mg / 24 hours
	Fentanyl 25 mcg / hour patch

ORAL/TRANSDERMAL AVAILABILITY OF COMMONLY PRESCRIBED OPIOIDS

Tramadol	50mg tablets
Morphine	Immediate-release: 30mg tablets Controlled-release: 15mg, 30mg, 60mg, 100mg tablets Oral solution: 20mg / 10mL, 20mg/mL
Oxycodone	Immediate-release: 5mg tablets Controlled-release: 10mg, 20mg, 40mg tablets Oral solution: 5mg / 5mL, 20mg/mL
Hydromorphone	2mg, 4mg tablets 3mg suppositories
Fentanyl	Transdermal patches: 12mcg, 25mcg, 50mcg, 75mcg, 100mcg

*For specific questions regarding hospital formulary, please contact the main pharmacy.
(Memorial Campus X46356, University Campus X62775)*

Suggestions Regarding Treatment of Side Effects:

Constipation:

The daily regimen should be increased if frequent rescue medication for constipation is necessary.

1. Opioid reduce peristalsis. All patients on opioids need a daily stimulant laxative to prevent constipation, as well as rescue medication if constipation persists.
2. Consider the following protocol:
 - i. Start with senna (max of 8 tabs/day) and docusate
 - ii. Order oral and rectal laxatives PRN and use if no bowel movement in 1-2 days.
 - iii. Titrate daily maintenance regimen as needed.
3. Note: Some patients are not appropriate to receive rectal laxatives or enemas (e.g. patients with neutropenia).

Nausea/Vomiting: tolerance will usually develop to opioid induced nausea/vomiting

1. Constipation may contribute or be the source of nausea so be sure to treat the constipation..
2. Consider pathophysiology of patients' nausea to guide treatment.
3. For opioid-induced nausea, dopamandergic agents can work best.
 - i. Metoclopramide - can also help with poor GI motility (watch for drug induced movement disorders)
 - ii. Haloperidol - non-sedating, 0.5mg IV every 6 hours PRN (watch for drug induced movement disorders)
 - iii. Prochlorperazine (Compazine) 25mg PR every 12 hours PRN nausea/vomiting
 - iv. Ondasetron - can be effective, especially in post-op setting; can cause constipation and headache

Pruritus:

1. Consider opioid rotation
2. Diphenhydramine can decrease the opioid induced histamine release that triggers itching.

 NS ORDER 0232 Rev 07/22/13

Urine Toxicology Screening

- No unified guidelines for urine toxicology screening but generally
 - Twice per year for low risk patients
 - At least monthly in higher risk patients or those with aberrant behavior
- Urine tox screens differ by labs, you must check those where you work; generally assess for
 - Opiates, benzodiazepines, barbiturates, cocaine, THC (principle active component of cannabis), amphetamine
 - See additional resources on the OSTI website

Urine Screen for Opioids

- Possible reasons for negative urine opiate screens
 - Immunoassays for opiates are based on finding morphine in the urine, which is the metabolite for morphine, codeine, and heroin.
 - These tests do not reliably detect synthetic and semisynthetic opioids, such as oxycodone, hydrocodone, methadone, buprenorphine, or fentanyl.
- If a provider needs to test for the presence of synthetic and semisynthetic opioids, he or she must order specific testing for these agents and communicate with the lab to make sure that the right type of testing is used for each patient.

Interpretation of Opioid Urine Drug Screens

Summary

Urine drug testing is highly reliable, but false positives can rarely occur for some drugs. As always, clinical judgment is necessary when interpreting test results. The length of time a drug can be detected in the urine varies due to several factors, including hydration, dosing, metabolism, body mass, urine pH, duration of use, and a drug's particular pharmacokinetics.

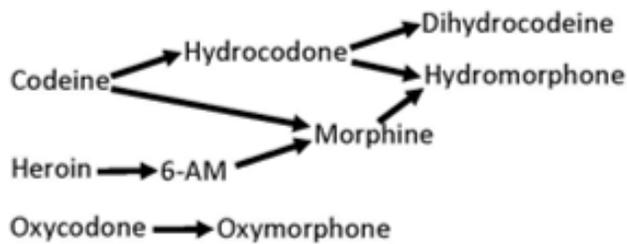

(See table below for some "average" times for different drugs.)

Length of Time Drugs of Abuse Can Be Detected in Urine Drug	Time
Alcohol	7-12 h
Amphetamine	48 h
Methamphetamine	48 h
Barbiturate	
Short-acting (eg, pentobarbital)	24 h
Long-acting (eg, phenobarbital)	3 wk
Benzodiazepine	
Short-acting (eg, lorazepam)	3 d
Long-acting (eg, diazepam)	30 d
Cocaine metabolites	2-4 d
Marijuana	
Single use	3 d
Moderate use (4 times/wk)	5-7 d
Daily use	10-15 d
Long-term heavy smoker	30 d
Opioids	
Codeine	48 h
Heroin (detected as morphine)	48 h
Hydromorphone	2-4 d
Methadone	3 d
Morphine	48-72 h
Oxycodone	2-4 d
Propoxyphene	6-48 h
Phencyclidine	8 d

– Mayo Clinic Proc. 2008; 83(1)66-76

Sometimes the specific drug ingested is not detected, but instead one of its metabolites is found.

Opiate/Opioid Metabolism

Fentanyl (Duragesic) is not easily detected in either urine or serum.

Drug	Half-life (hr)	Metabolites	Concentrations above the cutoff will screen positive for
morphine	1.5 - 6.5	normorphine, hydromorphone (<2.5%)	Opiates
codeine	1 - 4	morphine, hydrocodone (<11%), norcodeine	Opiates
oxycodone	4 - 12	oxymorphone, noroxycodone	Oxycodone
oxymorphone	3 - 6	6-hydroxy-oxymorphone	Oxycodone
hydrocodone	3.5 - 9	hydromorphone, norhydrocodone, dihydrocodeine	Opiates
hydromorphone	3 - 9	hydromorphol	Opiates

Clinical Guide for Changing Opioid Analgesics

Oral/Rectal (mg)	Analgesic	Parenteral (mg)
200 mg	Codeine	-
300mg	Tramadol*	-
30 mg	Hydrocodone	-
30 mg	Morphine	10 mg
20 mg	Oxycodone	-
6 mg	Hydromorphone	1.5 mg
-	Fentanyl	0.1 mg (100mcg)

Calculation Formula

To convert from one opioid or route of administration to another opioid or route of administration:

$$\text{current opioid dose (mg), route} \times \left(\frac{\text{FROM CHART desired opioid}}{\text{current opioid}} \right) = \text{desired opioid dose (mg), route}$$

Adjusting for Incomplete Cross Tolerance

Based on level of pain control at the time of conversion

Poor pain control	100%
Moderate pain control	75%
Excellent pain control	50%

Fentanyl Conversion

(Not to be used for acute pain management.)

Oral morphine 50 - 100 mg/24 hours ~

Fentanyl 25 mcg/hour patch

Oral/Transdermal Availability of Commonly Prescribed Opioids

Codeine	15 mg, 30 mg tablets
Tramadol	50 mg tablets
Morphine	Immediate-release: 30 mg tablets Controlled-release: 15 mg, 30 mg, 60 mg, 100 mg tablets Oral solution: 20mg/10ml, concentrate: 20mg/ml
Oxycodone	Immediate-release: 5 mg tablets Controlled-release: 10 mg, 20 mg, 40 mg tablets Oral solution: 5 mg/5ml, concentrate: 20 mg/ml
Hydromorphone	2 mg, 4 mg tablets 3 mg suppositories
Fentanyl	Transdermal patches: 25 mcg, 50 mcg, 75 mcg, 100 mcg

Combination Products: *No more than 8 tablets per day*

Codeine/APAP (Tylenol #3)	30mg codeine/300 mg acetaminophen tablets Oral solution: 36 mg codeine/360 mg acetaminophen/5 ml
Hydrocodone/APAP (Vicodin)	5 mg hydrocodone/500 mg acetaminophen tablet
Oxycodone/APAP (Percocet)	5 mg oxycodone/325 mg acetaminophen tablet

For specific questions regarding hospital formulary, please contact the main pharmacy (Memorial Campus x46356, University Campus x62775)

Safety Monitoring Guidelines

- Discuss the risks and benefits of opioid treatment with your patients openly.
- Thoroughly assess for risk of substance misuse disorder
- initially and continue monitoring for aberrant behavior
- For chronic opioids, establish prescription medication treatment agreement and review it periodically with patient (at least annually)
- Perform urine toxicology screening (see below)
- Perform pill counts
- Utilize the prescription drug monitoring program website
- Follow universal precautions! (see below)

Note: Chronic pain is defined as lasting >12 weeks (ICD 10)

Universal Precautions for safe prescribing of opiate medications

Table 4. The 10 steps of Universal Precautions^{35;60}

1.	Make a diagnosis with appropriate differential and a plan for further evaluation and investigation of underlying conditions to try to address the medical condition that is responsible for the pain
2.	Psychologic assessment, including risk of addictive disorders
3.	Informed consent
4.	Treatment agreement
5.	Pre-/post-treatment assessment of pain level and function
6.	Appropriate trial of opioid therapy +/- adjunctive medication
7.	Reassessment of pain score and level of function
8.	Regularly assess the "Four As" of pain medicine ^a <ul style="list-style-type: none">• Analgesia, Activity, Adverse reactions, and Aberrant behavior
9.	Periodically review management of the underlying condition that is responsible for the pain, the pain diagnosis and comorbid conditions relating to the underlying condition, and the treatment of pain and comorbid disorders
10.	Documentation of medical management and of pain management according to state guidelines and requirements for safe prescribing

Red and Yellow Flag Behaviors for Substance Use Disorders

Red

- Deterioration in functioning at work or socially
- Illegal activities—selling medications, forging prescriptions, or buying medications from nonmedical sources
- Using medications in ways other than prescribed (e.g., injecting or snorting medication)
- Multiple reports of lost or stolen prescriptions
- Resistance to change in medications despite adverse effects
- Refusal to comply with random drug screens, call backs, or pill counts
- Concurrent abuse of alcohol or drugs
- Use of multiple physicians and pharmacies

Yellow (could be normal but combined may be of concern)

- Complaints about need for more medication
- Drug hoarding
- Nonadherence to recommendations for non-medication pain therapies
- Acquiring similar medications from other providers
- Occasional unsanctioned dose escalation
- Requesting specific pain medications
- Taken in the context of a patient's presentation and history, this
 - could be a sign of “seeking” certain medications, or if patients ask
 - for specific medications it could be because this has worked in
 - the past. (consider a patient asking for a specific blood pressure
 - medicine that has worked well in the past, providers would likely
 - restart it immediately)

Key Concepts for OSTI

- Opioid use disorder is and should be treated as a chronic illness.
- The opiate epidemic has impacted communities of color for years. The current national focus suggests bias in the healthcare system, policy-makers and media.
- Safe-prescribing does not mean NO prescribing, even for patients in recovery.
- The prescription monitoring program (PMP or MassPAT) provides accurate, up-to-date prescribing information and must be accessed before prescribing
- Co-prescribing naloxone should be considered for any patient on chronic opiates.
- Best practices include risk assessment (including for diversion), informed consent, monitoring, safe storage and disposal counseling.
- Medication assisted treatment/Medications for opioid use disorder with agents such as methadone, buprenorphine or naltrexone can act as a bridge or long-term therapy to assist patients in overcoming opioid use disorders.
